## Specifications Overview:

- **CompactFlash Association Specification Revision 4.1 Standard Interface**
  - 512 bytes per sector
  - ATA command set compatible
  - ATA transfer mode supports:
    - PIO Mode 6
    - Multiword DMA Mode 4
    - Ultra DMA Mode 5
    - PCMCIA UDMA Mode 5
- **Capacity**
  - 128, 256, 512 MB
  - 1, 2, 4, 8, 16, 32, 64 GB
- **Performance\***
  - Sequential read: Up to 55 MB/sec
  - Sequential write: Up to 42 MB/sec
- **Flash Management**
  - Built-in hardware ECC
  - Global Wear Leveling
  - Flash bad-block management
  - S.M.A.R.T.
  - Power Failure Management
- **Endurance (in Terabytes Written: TBW)**
  - 128 MB: 0.5 TBW
  - 256 MB: 1.1 TBW
  - 512 MB: 2.3 TBW
  - 1 GB: 4.5 TBW
  - 2 GB: 9.1 TBW
  - 4 GB: 18.2 TBW
  - 8 GB: 36.5 TBW
  - 16 GB: 73.0 TBW
  - 32 GB: 146.0 TBW
  - 64 GB: 292.1 TBW
- **Temperature Range**
  - Operating:
    - Standard: 0°C to 70°C
    - Wide: -40°C to 85°C
  - Storage: -40°C to 100°C
- **Supply Voltage**
  - 3.3 V
  - 5.0 V
- **Power Consumption\***
  - Active mode: 175 mA
  - Idle mode: 3 mA
- **Connector Type**
  - 50 pins female
- **Physical Dimensions**
  - 36.4mm x 42.8mm x 3.3mm
- **NAND Flash Type: SLC**
- **Halogen Free**

\*Varies from capacities. The values for performances and power consumptions presented are typical and may vary depending on flash configurations or platform settings.

# 1. General Descriptions

Apacer's value-added Industrial CompactFlash Card offers high performance, high reliability and power-efficient storage. Regarding standard compliance, this CompactFlash Card complies with CompactFlash specification revision 4.1, supporting transfer modes up to Programmed Input Output (PIO) Mode 6, Multi-word Direct Memory Access (DMA) Mode 4, Ultra DMA Mode 5, and PCMCIA Ultra DMA Mode 5.

Apacer's value-added CFC provides complete PCMCIA – ATA functionality and compatibility. Apacer's CompactFlash technology is designed for applications in Point of Sale (POS) terminals, telecom, IP-STB, medical instruments, surveillance systems, industrial PCs and handheld applications such as the new generation of Digital Single Lens Reflex (DSLR) cameras.

## 1.1 Intelligent CompactFlash Module

### 1.1.1 Global Wear Leveling

Flash memory devices differ from Hard Disk Drives (HDDs) in terms of how blocks are utilized. For HDDs, when a change is made to stored data, like erase or update, the controller mechanism on HDDs will perform overwrites on blocks. Unlike HDDs, flash blocks cannot be overwritten and each P/E cycle wears down the lifespan of blocks gradually. Repeatedly program/erase cycles performed on the same memory cells will eventually cause some blocks to age faster than others. This would bring flash storages to their end of service term sooner. Global wear leveling is an important mechanism that levels out the wearing of all blocks so that the wearing-down of all blocks can be almost evenly distributed. This will increase the lifespan of SSDs.

### 1.1.2 S.M.A.R.T.

S.M.A.R.T. is an acronym for Self-Monitoring, Analysis and Reporting Technology, an open standard allowing disk drives to automatically monitor their own health and report potential problems. It protects the user from unscheduled downtime by monitoring and storing critical drive performance and calibration parameters. Ideally, this should allow taking proactive actions to prevent impending drive failure. Apacer SMART feature adopts the standard SMART command B0h to read data from the drive. When the Apacer SMART Utility running on the host, it analyzes and reports the disk status to the host before the device is in critical condition.

### 1.1.3 Built-in Hardware ECC

This CompactFlash card employs BCH Error Correction Code (ECC) algorithms. This on-chip hardware BCH-ECC engines is 13/24 bit programmed that can correct up to 24-bit errors per 1,024 byte data. This built-in hardware ECC performs parity generation and error detection/correction for data integrity.

## 1.1.4 Flash Block Management

Contemporary process technology is unable to guarantee total reliability of NAND flash memory array. When a flash memory device leaves factory, it comes with a highly minimal number of initial bad block during production or out-of-factory as there is no currently known technology that produce flash chips free of bad blocks. On the other hand, bad blocks may develop during program/erase cycles. When host performs program/erase command on a block, bad block may appear in Status Register. Since bad blocks are inevitable, the solution is to keep them in control. Apacer flash devices are programmed with ECC, block mapping technique and S.M.A.R.T to reduce invalidity or error. Once bad blocks are detected, data in those blocks will be transferred to free blocks and error will be corrected by designated algorithms.

## 1.1.5 Power Failure Management

Power Failure Management plays a crucial role when power supply becomes unstable. Power disruption may occur when users are storing data into the SSD, leading to instability in the drive. However, with Power Failure Management, a firmware protection mechanism will be activated to scan pages and blocks once power is resumed. Valid data will be transferred to new blocks for merging and the mapping table will be rebuilt. Therefore, data reliability can be reinforced, preventing damage to data stored in the NAND Flash.

## 2. Functional Block

The CompactFlash Card (CFC) includes a controller and flash media, as well as the CompactFlash standard interface. Figure 2-1 shows the functional block diagram.

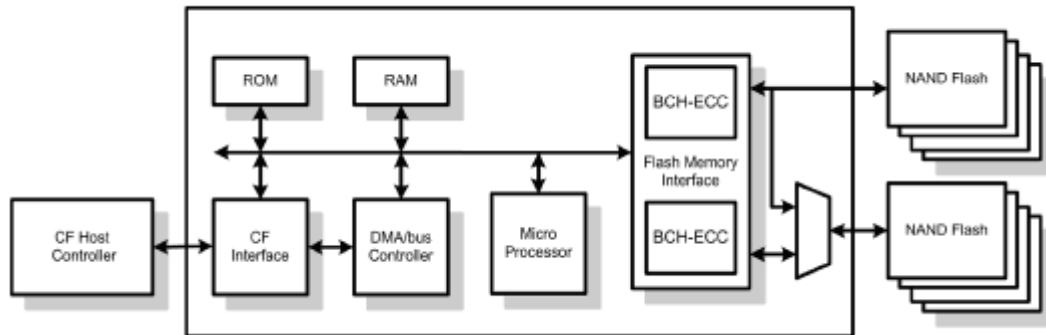

Figure 2-1 Functional Block Diagram

### 3. Pin Assignments

Table 3-1 lists the pin assignments with respective signal names for the 50-pin configuration. A “#” suffix indicates the active low signal. The pin type can be input, output or input/output.

## 4. Product Specifications

### 4.1 Capacity

Capacity specification of the Compact Flash Card series (CFC) is available as shown in Table 4-1. It lists the specific capacity and the default numbers of heads, sectors and cylinders for each product line.

**Table 4-1** Capacity Specifications

Capacity	Total bytes <sup>1</sup>	Cylinders	Heads	Sectors	Max LBA
128 MB	128,450,560	980	8	32	250,880
256 MB	256,901,120	980	16	32	501,760
512 MB	512,483,328	993	16	63	1,000,944
1GB	1,024,966,656	1,986	16	63	2,001,888
2GB	2,048,901,120	3,970	16	63	4,001,760
4GB	4,110,188,544	7,964	16	63	8,027,712
8GB	8,195,604,480	15,880	16	63	16,007,040
16GB	16,391,340,032	16,383	16	63	32,014,336
32GB	32,019,316,736	16,383	16	63	62,537,728
64 GB	64,030,244,864	16,383	16	83	125,059,072

<sup>1</sup>Display of total bytes varies from file systems, which means not all of the bytes can be used for storage.

\*\*Notes: 1 GB = 1,000,000,000 bytes; 1 sector = 512 bytes.

LBA count addressed in the table above indicates total user storage capacity and will remain the same throughout the lifespan of the device. However, the total usable capacity of the SSD is most likely to be less than the total physical capacity because a small portion of the capacity is reserved for device maintenance usages.

### 4.2 Performance

Performances of the CF cards are listed in Table 4-2.

**Table 4-2** Performance Specifications

Capacity	128 MB	256 MB	512 MB	1 GB	2 GB	4 GB	8 GB	16 GB	32 GB	64 GB
<b>Performance</b>										
<b>Sequential Read* (MB/s)</b>	21	24	47	45	55	55	55	48	57	50
<b>Sequential Write* (MB/s)</b>	6	6	22	19	25	35	42	38	27	26

Note:

Results may differ from various flash configurations or host system setting.

\*Sequential performance is based on CrystalDiskMark 5.2.1 with file size 1,000MB.

### 4.3 Environmental Specifications

Environmental specifications of the Compact Flash Card series (CFC) are shown in Table 4-3.

**Table 4-3** Environmental Specifications

Environment		Specifications
Temperature	Operating	0°C to 70°C (Standard); -40°C to 85°C (Wide)
	Storage	-40°C to 100°C
Vibration (Non-Operation)		Sine wave : 10~2000Hz, 15G (X, Y, Z axes)
Shock (Non-Operation)		Half sine wave 1,500G (X, Y, Z ; All 6 axes)

### 4.4 Certification and Compliance

The CompactFlash card complies with the following global standards:

- CE
- FCC
- Halogen-free
- CompactFlash Association Specification Revision 4.1
- EMC

### 4.5 Endurance

The endurance of a storage device is predicted by TeraBytes Written based on several factors related to usage, such as the amount of data written into the drive, block management conditions, and daily workload for the drive. Thus, key factors, such as Write Amplifications and the number of P/E cycles, can influence the lifespan of the drive.

**Table 4-4** Endurance Specifications

Capacity	TeraBytes Written
128 MB	0.5
256 MB	1.1
512 MB	2.3
1 GB	4.5
2 GB	9.1
4 GB	18.2
8 GB	36.5
16 GB	73.0
32 GB	146.0
64 GB	292.1

Note:

- The measurement assumes the data written to the SSD for test is under a typical and constant rate.
- The measurement follows the standard metric: 1 TB (Terabyte) = 1,000 GB.
- The estimated values are based on JEDEC Enterprise endurance workload comprised of random data with the payload size distribution with sequential write behavior.

## 6. Electrical Specifications

### 6.1 Operating Voltage

Table 6-1 and 6-2 list the supply voltage for CompactFlash card.

**Caution: Absolute Maximum Stress Ratings** – Applied conditions greater than those listed under “Absolute Maximum Stress Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these conditions or conditions greater than those defined in the operational sections of this data sheet is not implied. Exposure to absolute maximum stress rating conditions may affect device reliability.

**Table 6-1** Operating Range

Item	Range
Supply Voltage	3.3V ± 5% (3.135-3.465V)
	5V ± 5% (4.75-5.25V)

**Table 6-2** Absolute Maximum Power Pin Stress Ratings

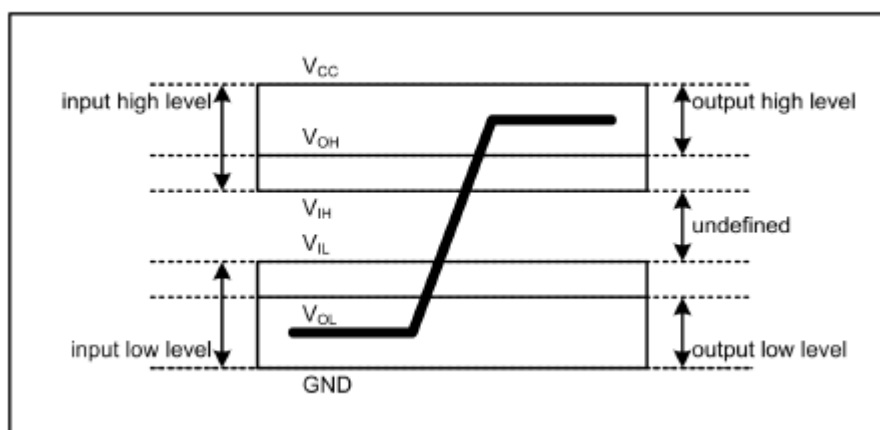

Parameter	Symbol	Conditions
Input Power	$V_{DD}$	-0.3V min. to 6.5V max.
Voltage on any pin except $V_{DD}$ with respect to GND	V	-0.5V min. to $V_{DD} + 0.5V$ max.

### 6.2 AC/DC Characteristics

The following section provides general AC/DC characteristics of this CompactFlash card.

#### 6.2.1 General DC Characteristics

Definitions of  $V_{IH}$ ,  $V_{CC}$ ,  $V_{OH}$ ,  $V_{OL}$

- **CompactFlash Interface I/O at 5.0V**

Parameter	Symbol	Minimum	Maximum	Unit	Remark
Supply Voltage	V <sub>CC</sub>	4.5	5.5	V	
High Level Output Voltage	V <sub>OH</sub>	V <sub>CC</sub> -0.8		V	
Low Level Output Voltage	V <sub>OL</sub>		0.8	V	
High Level Input Voltage	V <sub>IH</sub>	4.0		V	Non-Schmitt trigger
		2.92		V	Schmitt trigger
Low Level Input Voltage	V <sub>IL</sub>		0.8	V	Non-Schmitt trigger
			1.70	V	Schmitt trigger
Pull-up Resistance	R <sub>PU</sub>	50	73	kOhm	
Pull-down Resistance	R <sub>PD</sub>	50	97	kOhm	

- **CompactFlash Interface I/O at 3.3V**

Parameter	Symbol	Minimum	Maximum	Unit	Remark
Supply Voltage	V <sub>CC</sub>	2.97	3.63	V	
High Level Output Voltage	V <sub>OH</sub>	V <sub>CC</sub> -0.8		V	
Low Level Output Voltage	V <sub>OL</sub>		0.8	V	
High Level Input Voltage	V <sub>IH</sub>	2.4		V	Non-Schmitt trigger
		2.05		V	Schmitt trigger
Low Level Input Voltage	V <sub>IL</sub>		0.6	V	Non-Schmitt trigger
			1.25	V	Schmitt trigger
Pull-up Resistance	R <sub>PU</sub>	52.7	141	kOhm	
Pull-down Resistance	R <sub>PD</sub>	47.5	172	kOhm	

- **Non-CF Interface I/O Pins**

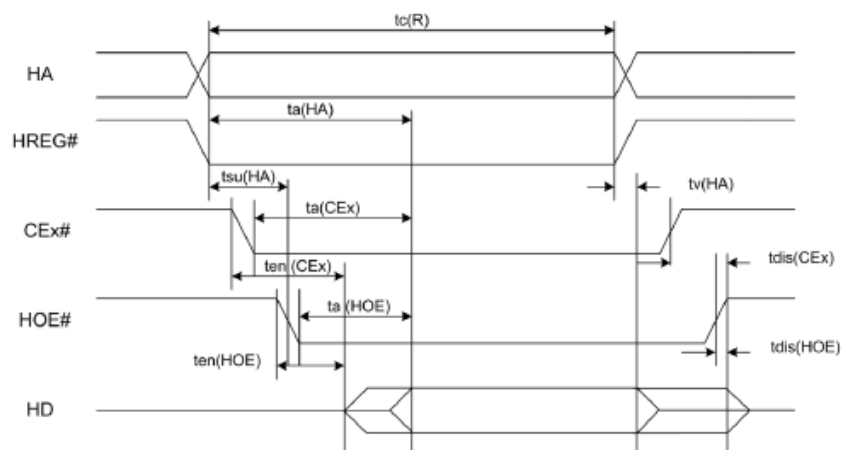

Parameter	Symbol	Minimum	Maximum	Unit	Remark
Supply Voltage	V <sub>CC</sub>	2.7	3.6	V	
High Level Output Voltage	V <sub>OH</sub>	2.4		V	
Low Level Output Voltage	V <sub>OL</sub>		0.4	V	
High Level Input Voltage	V <sub>IH</sub>	2.0		V	Non-Schmitt trigger
		1.4	2.0	V	Schmitt trigger
Low Level Input Voltage	V <sub>IL</sub>		0.8	V	Non-Schmitt trigger
		0.8	1.2	V	Schmitt trigger
Pull-up Resistance	R <sub>PU</sub>	40		kOhm	
Pull-down Resistance	R <sub>PD</sub>	40		kOhm	

Note: the Schmitt trigger includes CompactFlash I/O pins such as CE1#, CE2#, HREG#, HOE#, HIOE#, HWE# and HIOW#, as well as non CompactFlash I/O pins like RST#, T0, T1, and T2.

## 6.2.2 General AC Characteristics

- Attribute Memory Read Timing

Item	Symbol	Min. (ns)	Max. (ns)
Read Cycle Time	tc (R)	300	
Address Access Time	ta (HA)		300
Card Enable Access Time	ta (CEx)		300
Output Enable Access Time	ta (HOE)		150
Output Disable Time from CEx#	tdis (CEx)		100
Output Disable Time from HOE#	tdis (HOE)		100
Address Setup Time	tsu (HA)	30	
Output Enable Time from CEx#	ten (CEx)	5	
Output Enable Time from HOE#	ten (HOE)	5	
Data Valid from Address Change	tv (HA)	0	

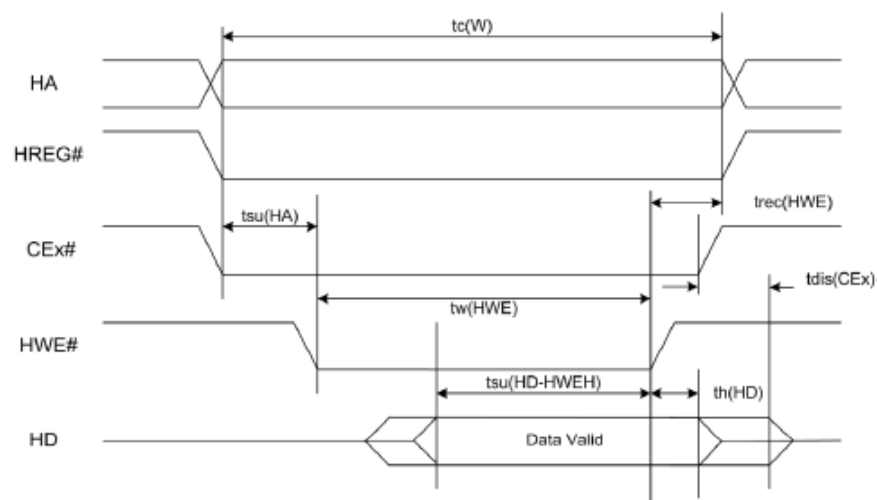

Notes: all time intervals are in nanoseconds. HD refers to the data provided by the CompactFlash card to the system. The CEx# signal or both of the HOE# and the HWE# signal are de-asserted between consecutive cycle operations.

- Attribute Memory Write Timing**

Item	Symbol	Min. (ns)	Max. (ns)
Write Cycle Time	tc (W)	250	
Write Pulse Width	tw (HWE)	150	
Address setup Time	tsu (HA)	30	
Write Recovery Time	trec (HWE)	30	
Data Setup Time for HWE#	tsu (HD-HWEH)	80	
Data Hold Time	th (HD)	30	

Notes: all time intervals are in nanoseconds. HD refers to the data provided by the CompactFlash card to the system.

● Common Memory Read Timing

Cycle Time Mode		250 ns		120 ns		100 ns		80 ns	
Item	Symbol	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.
Output Enable Access Time	$t_a$ (HOE)		125		60		50		45
Output Disable Time from HOE#	$t_{dis}$ (HOE)		100		60		50		45
Address Setup Time	$t_{su}$ (HA)	30		15		10		10	
Address Hold Time	$t_h$ (HA)	20		15		15		10	
CEx# Setup before HOE#	$t_{su}$ (CEx)	5		5		5		5	
CEx# Hold following HOE#	$t_h$ (CEx)	20		15		15		10	
Wait Delay falling from HOE#	$t_v$ (IORDY-HOE)		35		35		35		Na
Data Setup for Wait Release	$t_v$ (IORDY)		0		0		0		Na
Wait Width Time	$t_w$ (IORDY)		350		350		350		Na

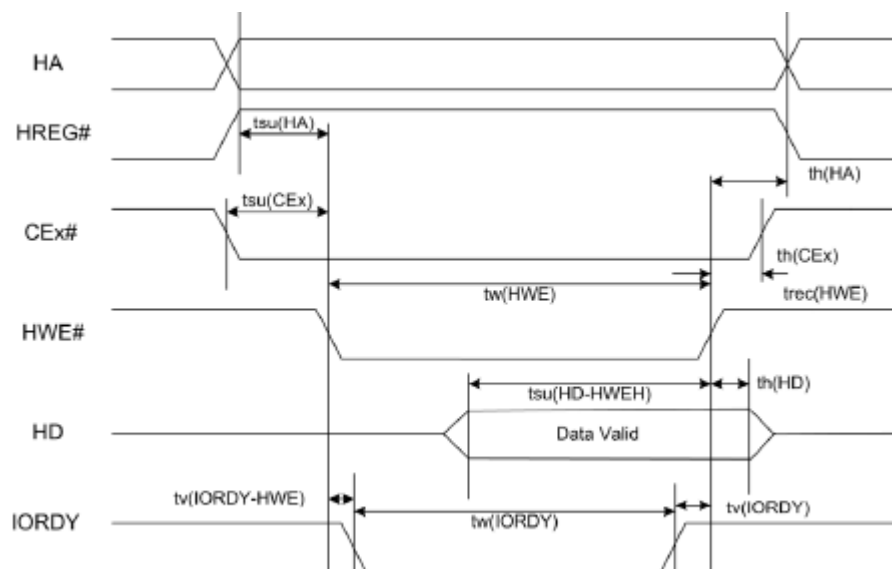

Note: IORDY is not supported in this 80 ns mode. The maximum load on IORDY is 1 LSTTL with a 50 pF (40 pF below 120 nsec cycle time) total load. All time intervals are in nanoseconds. HD refers to the data provided by the CompactFlash card to the system. The IORDY signal can be ignored when the HOE# cycle-to-cycle time is greater than the Wait Width Time. The Max Wait Width Time can be determined from the Card Information Structure (CIS). Although adhering to the PCM-CIA specification, the Wait Width Time is intentionally designed to be lower in this specification.

● Common Memory Write Timing

Cycle Time Mode		250 ns		120 ns		100 ns		80 ns

IORDY Assertion to Release (Max.)	tC	5	5	5	5	5	Na	Na

\*All timing intervals are measured in nanoseconds. The maximum load on IOCS16# is 1 LSTTL with a 50 pF (40 pF below 120 nsec cycle time) total load. All time intervals are in nanoseconds. Although minimum time from IORDY high to HIOE# high is 0 nsec, the minimum HIOE# width is still met.

Where t0 denotes the minimum total cycle time; t2 represents the minimum command active time; t2i is the minimum command recovery time or command inactive time. Actual cycle time equals to the sum of actual command active time and actual command inactive time. The three timing requirements for t0, t2, and t2i are met. The minimum total cycle time requirement is greater than the sum of t2 and t2i, implying that a host implementation can extend either or both t2 or t2i to ensure that t0 is equal to or greater than the value reported in the device identity data. A CompactFlash card implementation supports any legal host implementation.

The delay originates from HIOW# or HIOE# activation until the state of IORDY is first sampled. If IORDY is inactive, the host waits until IORDY is active before the PIO cycle is completed. When the CompactFlash Card is not driving IORDY, which is negated at tA after HIOE# or HIOW# activation, then t5 is met and tRD is inapplicable. When the CompactFlash Card is driving IORDY, which is negated at the time tA after HIOE# or HIOW# activation, then tRD is met and t5 is inapplicable.

Both t7 and t8 apply to modes 0, 1, and 2 only. For other modes, the signal is invalid. IORDY is not supported in this mode.

Device address comprises CE1#, CE2#, and HA[2:0]

Data comprises HD[15:0] (16-bit) or HD[7:0] (8-bit)

IOCS16# is shown for PIO modes 0, 1, and 2. For other modes, the signal is ignored.

The negation of IORDY by the device is used to lengthen the PIO cycle. Whether the cycle is to be extended is determined by the host after  $t_A$  from the assertion of HIOE# or HIOW#. The assertion and negation of IORDY is described in the following cases. First, the device never negates IORDY, so no wait is generated. Secondly, device drives IORDY low before  $t_A$ . Thus, wait is generated. The cycle is completed after IORDY is re-asserted. For cycles in which a wait is generated and HIOE# is asserted, the device places read data on D15-D00 for  $t_{RD}$  before IORDY is asserted.

CEx# valid to HIOE#/HIOW#	tM	50	30	25	10	5
CEx# hold	tN	15	10	10	10	10

Note: Where tO is the minimum total cycle time and tD is minimum command active time, whereas tKR and tKW are minimum command recovery time or command inactive time for input and output cycles, respectively. Actual cycle time equals to the sum of actual command active time and actual command inactive time. The three timing requirements of tO, for instance, tD, tKR, and tKW, must be met. The minimum total cycle time requirement exceeds the sum of tD and tKR or tKW for input and output cycles respectively, implying that a host implementation can extend either or both tD and tKR or tKW as deemed necessary to ensure that tO equals or exceeds the value reported in the device identify data. A CompactFlash card implementation supports any legal host, appropriate host implementation.

If a card cannot sustain continuous, minimum cycle time DMA transfers, it may negate DMARQ during the time from the start of a DMA transfer cycle (to suspend DMA transfers in progress) and re-assertion of the signal at a relatively later time to continue DMA transfer operations. The host may negate this signal to suspend the DMA transfer in progress.

Notes:

All timing are in nanoseconds and all timing measurement switching points (low to high and high to low) are taken at 1.5V. All signal transitions for a timing parameter are determined at the connector specified in the measurement location column. Parameter  $t_{CYC}$  is determined at the connector of the recipient farthest from the sender, while parameter  $t_{LI}$  is determined at the connector of a sender or recipient responding to an incoming transition from the recipient or sender, respectively. Both incoming signal and outgoing response are determined at the same connector. Parameter  $t_{AZ}$  is determined at the connector of a sender or recipient driving the bus, and must release the bus to allow for a bus turnaround.

● Ultra DMA Data Burst Timing Descriptions

Parameter	Description & Comment	Note
$t_{2CYCTYP}$	Typical sustained average two cycle time	
$t_{CYC}$	Cycle time allowing for asymmetry and clock variations (from STROBE edge to STROBE edge)	
$t_{2CYC}$	Two cycle time allowing for clock variations (from rising edge to next rising edge or from falling edge to next falling edge of STROBE)	
$t_{DS}$	Data setup time at recipient (from data valid until STROBE edge)	2, 5
$t_{DH}$	Data hold time at recipient (from STROBE edge until data may become invalid)	2,5
$t_{DVS}$	Data valid setup at sender (from data valid until STROBE edge)	3
$t_{DVH}$	Data valid hold time at sender (from STROBE edge until data may become invalid)	3
$t_{CS}$	CRC word setup time at device	2
$t_{CH}$	CRC word hold time at device	2
$t_{CVS}$	CRC word valid setup time at host (from CRC valid until DMACK(#) negation)	3
$t_{CVH}$	CRC word valid hold time at sender (from DMACK(#) negation until CRC may become invalid)	3
$t_{ZFS}$	Time from STROBE output released-to-driving until the first transition of critical timing	
$t_{DZFS}$	Time from data output released-to-driving until the first transition of critical timing)	
$t_{FS}$	First STROBE time (for device to first negate DSTROBE from STOP during a data in burst)	
$t_{LI}$	Limited interlock time	1
$t_{MLI}$	Interlock time with minimum	1
$t_{UI}$	Unlimited interlock time	1
$t_{AZ}$	Maximum time allowed for output drives to release (from asserted or negated)	
$t_{ZAH}$	Minimum delay time required for output	
$t_{ZAD}$	Drivers to assert or negate (from released)	
$t_{ENV}$	Envelope time (from DMACK(#) to STOP and HDMARDY# during data in burst initiation and from DMACK(#) to STOP during data out burst initiation)	
$t_{RFS}$	Ready-to-final-STROBE time (no STROBE edges shall be sent this long after negation of DMARDY#)	
$t_{RP}$	Ready-to-pause time (that recipient shall wait to pause after negating DMARDY#)	
$t_{IORDYZ}$	Maximum time before releasing IORDY	6
$t_{ZIORDY}$	Minimum time before driving IORDY	4, 6
$t_{ACK}$	Setup and hold times for DMACK(#) (before assertion or negation)	
$t_{SS}$	Time from STROBE edge to negation of DMARQ(#) or assertion of STOP (when sender terminates a burst)	

Notes:

1. Parameters tUI, tMLI and tLI represent sender-to-recipient or recipient-to-sender interlocks, for instance, one agent (sender or recipient) is waiting for the other agent to respond with a signal before proceeding. Parameter tUI denotes an unlimited interlock that has no maximum time value; tMLI represents a limited time-out that has defined minimum; tLI is a limited time-out that has a defined maximum.

2. The 80-conductor cabling is required to meet setup ( $t_{DS}$ ,  $t_{CS}$ ) and hold ( $t_{DH}$ ,  $t_{CH}$ ) times in modes exceeding 2.
3. Timing for  $t_{DVS}$ ,  $t_{DVH}$ ,  $t_{CVS}$ , and  $t_{CVH}$  must be met for lumped capacitive loads of 15 and 40 pF at the connector where the data and STROBE signals have the same capacitive load value.
4. Fall all timing modes, parameter  $t_{ZIORDY}$  may be greater than  $t_{ENV}$  since the host has a pull up on IORDY giving it a known state when released.
5. Parameters  $t_{DS}$  and  $t_{DH}$  for mode 5 are defined for a recipient at the end of a cable only in a configuration that has a single device located at the cable end. This configuration can result in  $t_{DS}$ , and  $t_{DH}$  for mode 5 at the middle connector having minimum values of 3.0 and 3.9 nanoseconds respectively.
6. The parameters are only applied to True IDE mode operation.

## ● Ultra DMA Sender & Recipient IC Timing Requirements

Item	UDMA Mode 0 (ns)		UDMA Mode 1 (ns)		UDMA Mode 2 (ns)		UDMA Mode 3 (ns)		UDMA Mode 4 (ns)		UDMA Mode 5 (ns)	
	Min.	Max.	Min.	Max.	Min.	Min.	Max.	Max.	Min.	Max.	Min.	Max.

$t_{DVSIC}$	72.9		50.9		33.9		22.6		9.5		6.0	
$t_{DVHIC}$	9.0		9.0		9.0		9.0		9.0		6.0	
$t_{DSIC}$	Recipient IC data setup time (from data valid until STROBE edge)											
$t_{DHIC}$	Recipient IC data hold time (from STROBE edge until data may become invalid)											
$t_{DVSIC}$	Sender IC data valid setup time (from data valid until STROBE edge)											
$t_{DVHIC}$	Sender IC data valid hold time (from STROBE edge until data may become invalid)											

Note: all timing switching point measurements are taken at 1.5V. The correct data value is captured by the recipient given input data with a slew rate of 0.4 V/ns rising and falling and the input STROBE with a slew rate of 0.4 V/ns rising and falling at  $t_{DSIC}$  and  $t_{DHIC}$  timing (measured at 1.5V). Parameters  $t_{DVSIC}$  and  $t_{DVHIC}$  must be met for lumped capacitive loads of 15 and 40 pF at the IC where all signals have the same capacitive load value. Noise that can couple onto the output signals from external sources is not included in these values.

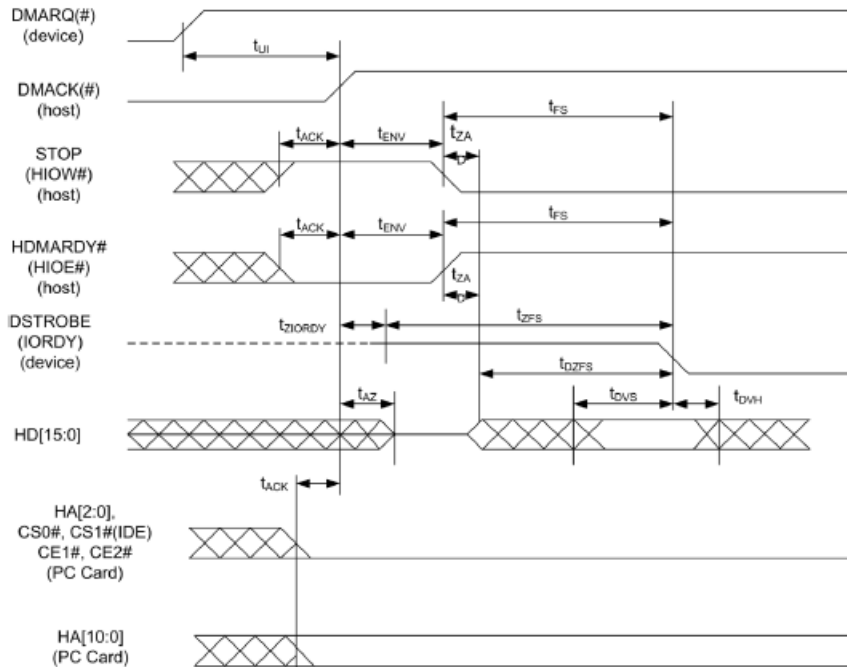

## ● Ultra DMA AC Signal Requirements

Item	Symbol	Min. (V/ns)	Max. (V/ns)
Rising Edge Slew Rate for any signal	$S_{RISE}$		1.25
Falling Edge Slew Rate for any signal	$S_{FALL}$		1.25

Notes:

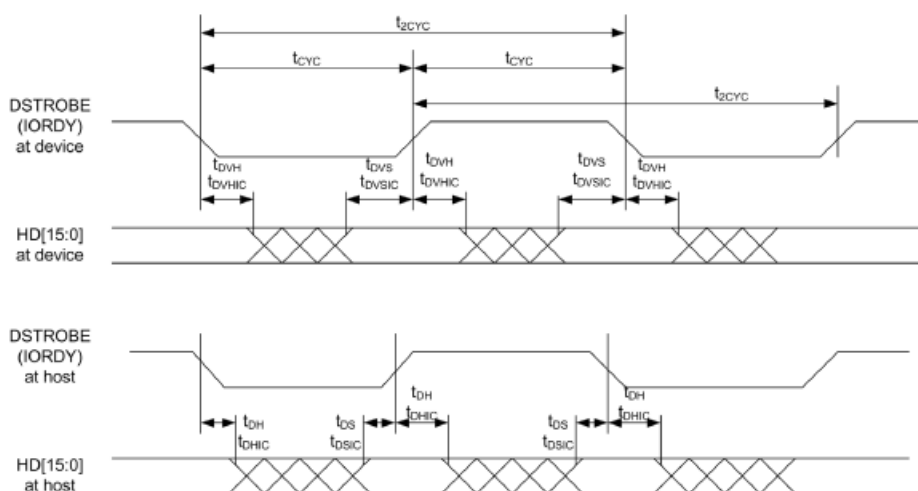

1. The sender is tested while driving an 18-inch, 80-conductor cable with PVC insulation. The signal being tested must be cut at a test point such that it has no trace, cable, or recipient loading after the test point. All other signals must remain connected through to the recipient. The test point should be located between a sender's series termination resistor and within 0.5 inch or less from where the conductor exits the connector. If the test point is on a cable conductor rather than on the PCB, an adjacent ground conductor must also be cut within 0.5 inch of the connector.
2. The test load and test points should be soldered directly to the exposed source side connectors. The test loads consist of a 15 pF or a 40 pF, 5%, 0.08 inch by 0.05 inch surface mount or relatively smaller capacitor connected between the test point and ground. Slew rates are met for both capacitor values.
3. Measurements must be taken at the test point using a <1 pF, >100 Kohm, 1GHz probe and a 500 MHz oscilloscope. The average rate is measured from 20% ~ 80% of the settled VOH level with data transitions at least 120 nanoseconds apart. The settled VOH level must be measured as the average high output level under the defined test conditions from 100 nanoseconds after 80% of a rising edge until 20% of the subsequent falling edge.

● Ultra DMA Data-in Burst Initiation Timing

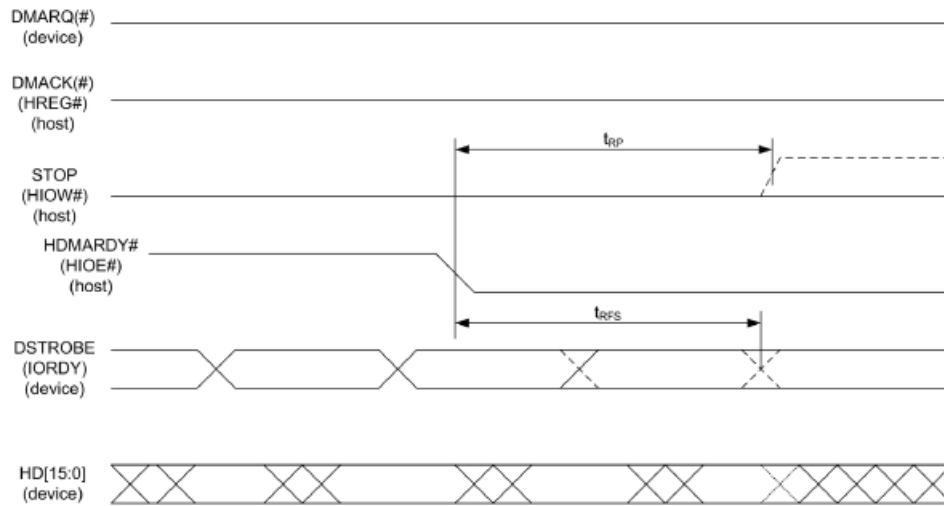

1. All waveforms in this diagram are shown with the asserted state high. Negative true signals are inverted on the bus relative to the diagram.
2. The definitions for the IORDY:DDMARDY#:DSTROBE, HIOE#: HDMARDY#: HSTROBE and HIOW#: STOP signal lines are not in effect until DMARQ(#) and DMACK(#) are asserted. Notably, HA[2:0], CS0# and CS1# are True IDE mode signal definitions, and HA[10:0], CE1# and CE2# are PC Card mode signals. The Bus polarity of DMACK(#) and DMARQ(#) is based on the active interface mode.

● Sustained Ultra DMA Data-in Burst Timing

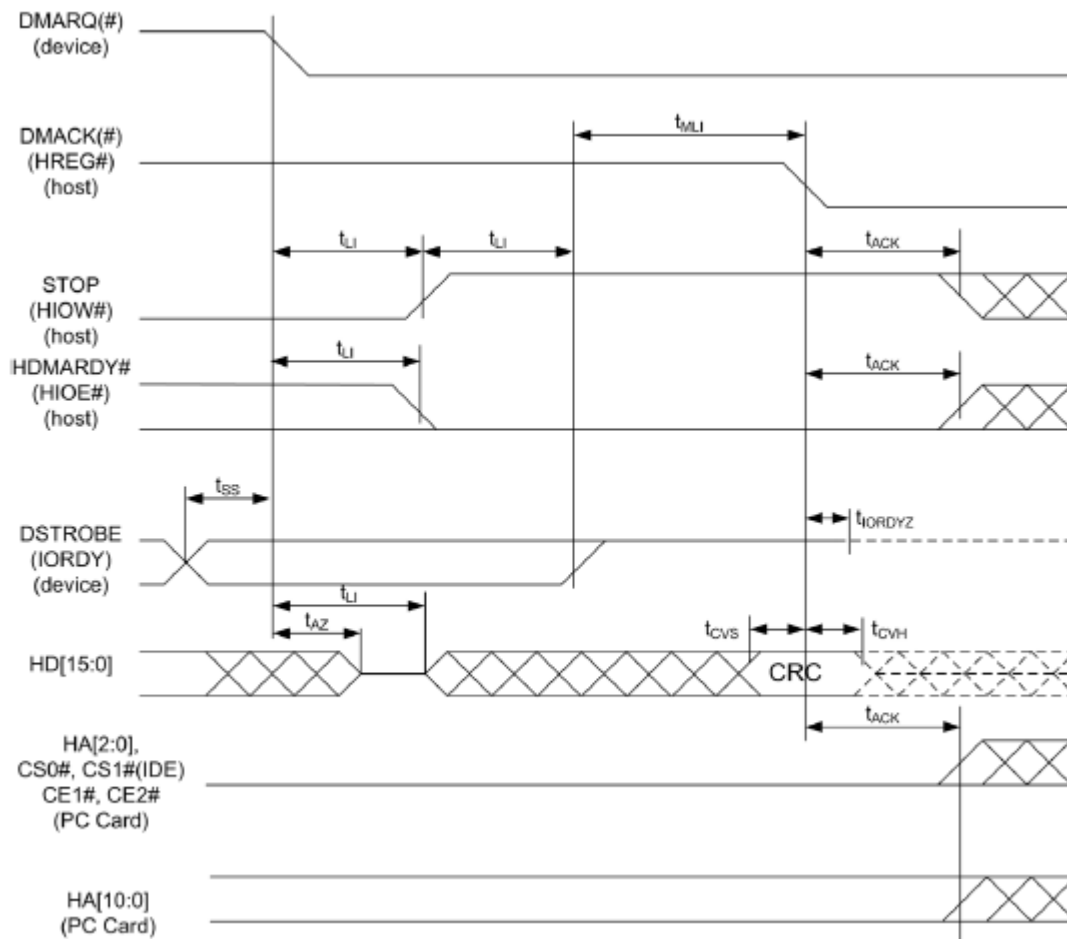

HD[15:0] and IORDY signals are shown at both the host and device to emphasize that neither cable settling time nor cable propagation delay allow data signals to be considered stable at the host until after they are driven by the device.

● Ultra DMA Data-in Burst Host Pause Timing

1. All waveforms in this diagram are shown with the asserted state high. Negative true signals are inverted on the bus relative to the diagram.
2. The host can implement STOP to request termination of the Ultra DMA data burst at a time no sooner than when t<sub>RP</sub> after HDMARDY# is negated.
3. After negating HDMARDY#, the host may receive zero, 1, 2, or 3 additional data words from the device.
4. Bus polarities of the DMARQ(#) and DMACK(#) signals are dependent on the active interface mode.

- Ultra DMA Data-in Burst Device Termination Timing

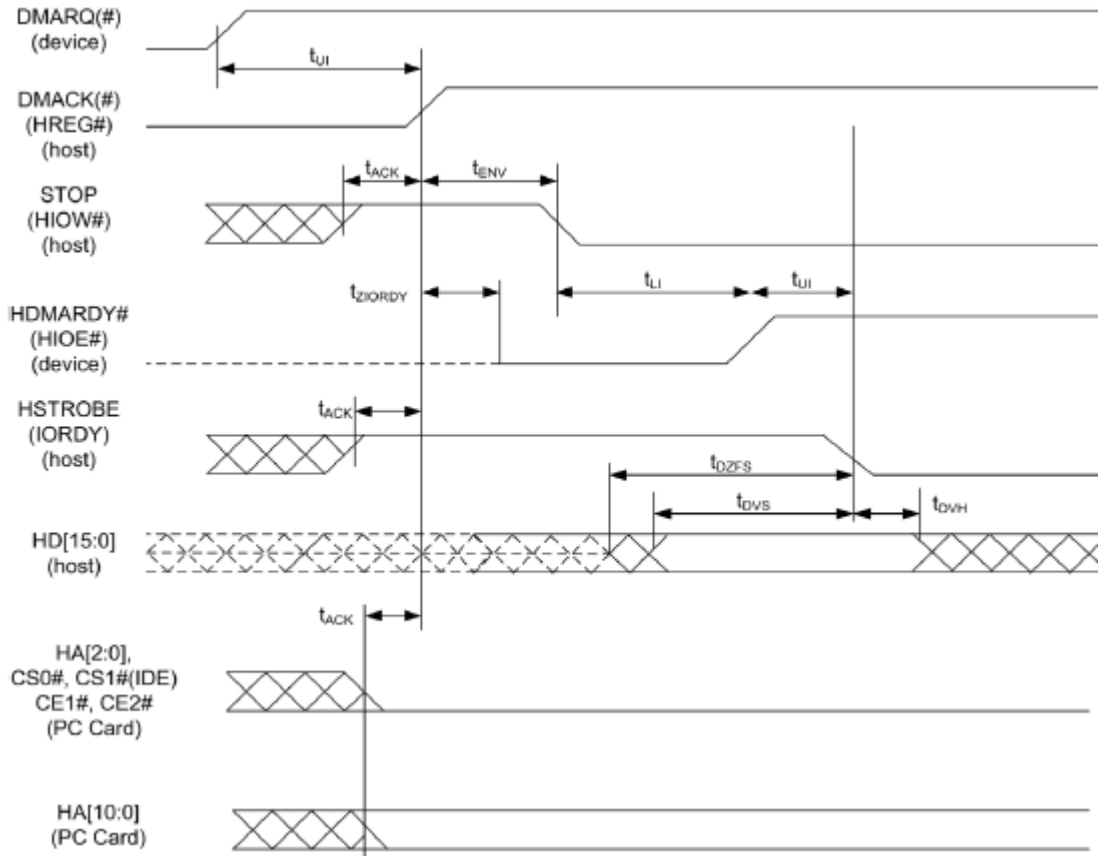

1. All waveforms in this diagram are shown with the asserted state high. Negative true signals are inverted on the bus relative to the diagram.
2. Definitions for STOP, HDMARDY#, and DSTROBE signal lines are no longer in effect once DMARQ(#) and DMACK(#) are negated. The HA[2:0], CS0# and CS1# are True IDE mode signal definitions. HA[10:0], CE1# and CE2# are PC Card mode signals. Bus polarities of DMARQ(#) and DMACK(#) are dependent on the active interface mode.

The HA[2:0], CS0# and CS1# are True IDE mode signal definitions. The HA[10:0], CE1# and CE2# are PC Card mode signal definitions. Bus polarities of DMARQ(#[device]) and DMACK(#[HREG#] host) are dependent on the active interface mode.

- Sustained Ultra DMA Data-out Burst Timing**

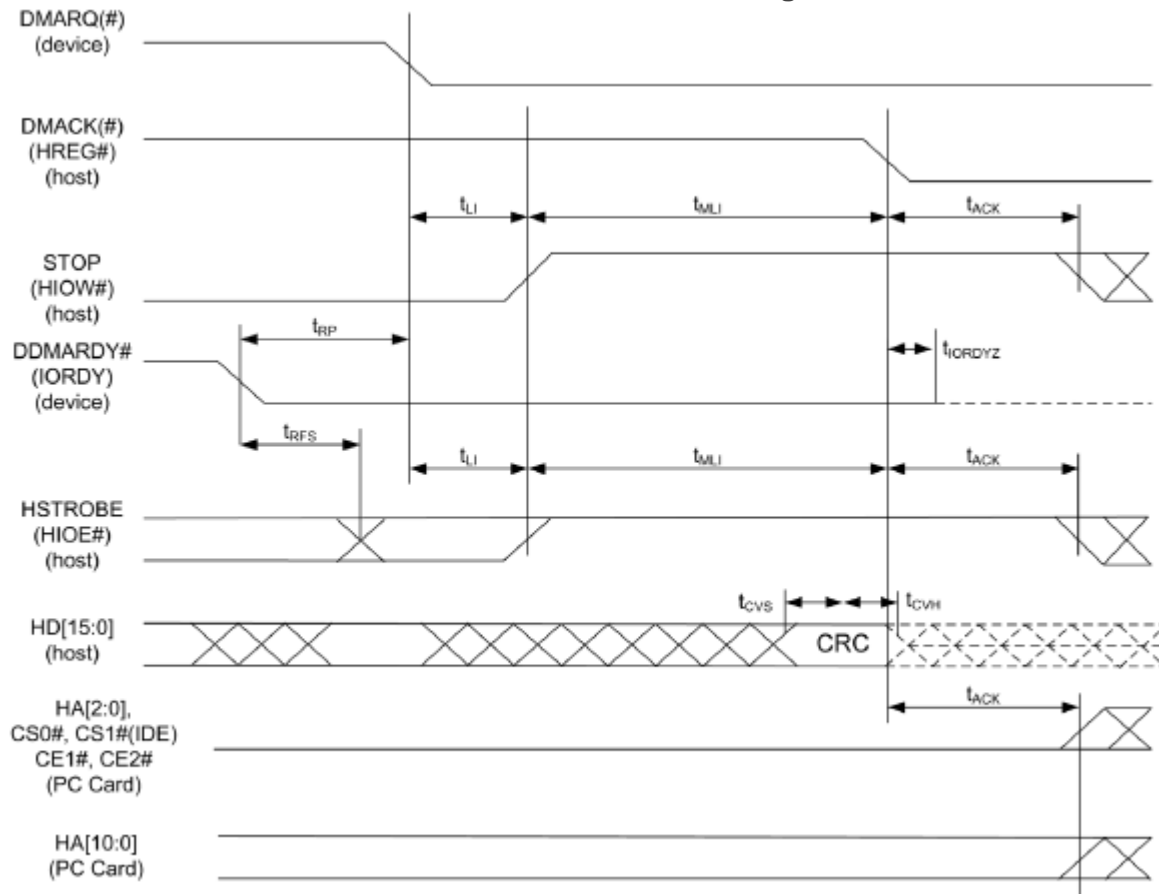

Data (HD[15:0]) and HSTROBE signals are shown at both the device and host to emphasize that neither cable settling time nor cable propagation delay allow for data signals to be considered stable at the device until after they are driven by a host.

- Ultra DMA Data-out Burst Device Pause Timing**

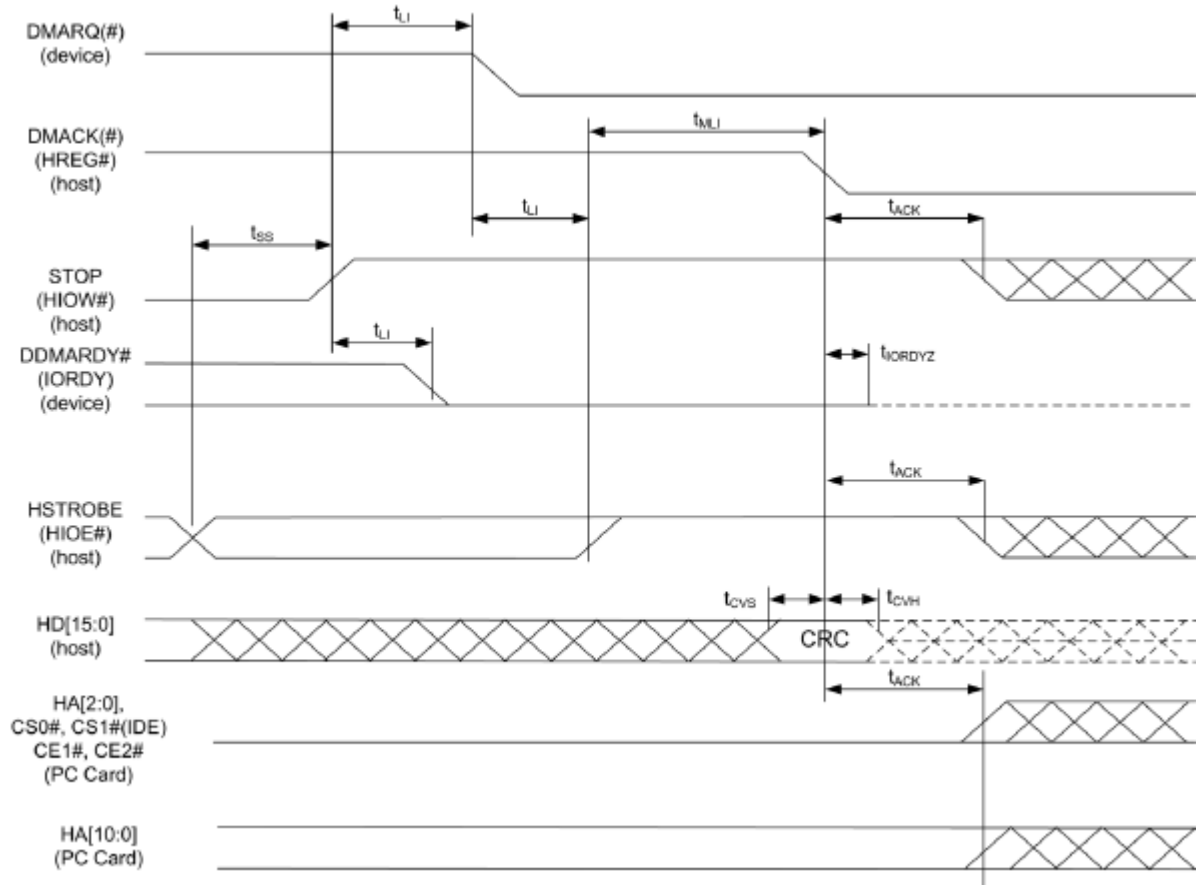

1. All waveforms in this diagram are shown with the asserted state high. Negative true signals are inverted on the bus relative to the diagram.
2. The device can negate DMARQ(#) when requesting termination of the Ultra DMA data burst no sooner than  $t_{\text{rp}}$  after DDMARDY# is negated.
3. After negating DDMARDY#, the device may receive zero, 1, 2, or 3 additional data words from the host.
4. The bus polarities of DMARQ(#) and DMACK(#) are dependent on the active interface mode.

- Ultra DMA Data-out Burst Device Termination Timing

Bus polarities of DMARQ(#) and DMACK(#) are dependent on the active interface mode.

- Ultra DMA Data-out Burst Host Termination Timing

1. All waveforms in this diagram are shown with the asserted state high. Negative true signals are inverted on the bus relative to the diagram.
2. Definitions for the STOP, DDMARDY#, and HSTROBE signal lines are no longer in effect once DMARQ# and DMACK# are negated. The HA[2:0], CS0# and CS1# are True IDE mode signal definitions. The HA[10:0], CE1# and CE2# are PC Card mode signal definitions. Bus polarities of DMARQ# and DMACK# are dependent on the active interface mode.
