Specifications Overview:

- **Fully Compatible with SD Card Association Specifications**
  - Physical Layer Specification Ver6.1
  - Security Specification Ver4.0
- **Capacity**
  - 32, 64, 128, 256 GB
- **Performance***
  - Sequential read: Up to 90 MB/sec
  - Sequential write: Up to 34 MB/sec
  - Random read (4K): Up to 1,300 IOPS
  - Random write (4K): Up to 42 IOPS
- **Flash Management**
  - Built-in advanced ECC algorithm
  - Global Wear Leveling
  - Flash bad-block management
  - DataRAID™
  - S.M.A.R.T.
  - SMART Read Refresh™
- **NAND Flash Type:** Toshiba TLC BiCS3 64 Layers
- **SD-Protocol Compatible**
- **Supports SD SPI Mode**
- **Backward Compatible with 3.0 and 2.0**
- **Endurance (in Terabytes Written: TBW)**
  - 32 GB: 82 TBW
  - 64 GB: 163 TBW
  - 128 GB: 312 TBW
  - 256 GB: 614 TBW
- **Temperature Range**
  - Operating:
    Standard: -25°C to 85°C
    Wide: -40°C to 85°C
  - Storage: -40°C to 85°C
- **Operating Voltage: 2.7V ~ 3.6V**
- **Power Consumption***
  - Operating: 105 mA
  - Standby: 185 µA
- **Bus Speed Mode:** Support Class 10 with UHS-I and UHS-3**
  - SDR12: SDR up to 25MHz 1.8V signaling
  - SDR25: SDR up to 50MHz 1.8V signaling
  - SDR50: 1.8V signaling, frequency up to 100MHz, up to 50 MB/sec
  - SDR104: 1.8V signaling, frequency up to 208MHz, up to 104MB/sec
  - DDR50: 1.8V signaling, frequency up to 50MHz, sampled on both clock edges, up to 50 MB/sec
- **Physical Dimensions**
  - 32mm (L) x 24mm (W) x 2.1mm (H)
- **Supports Video Speed Class**
  - V10: 32 GB
  - V30: 64-256 GB
- **RoHS Recast Compliant**

*Performance values presented here are typical and measured based on USB 3.0 card reader. The results may vary depending on settings and platforms.
**Class 10 with UHS-I is supported on 32GB while Class 10 with UHS-3 is supported on 64-256GB; timing in 1.8V signaling is different from that of 3.3V signaling.

1. General Descriptions

Apacer SD CV110-SD is compatible with the SD card version 6.1. The command list supports [Physical Layer Specification Ver6.10 Final] definitions. Card Capacity of Non-secure Area, Secure Area Supports [Part 3 Security Specification Ver4.00 Final] Specifications.

The SD 6.1 card comes with 9-pin interface designed to operate at a maximum operating frequency of 208MHz. It can alternate communication protocol between the SD mode and SPI mode. It performs data error detection and correction with very low power consumption. It supports capacity up to 256GB with exFAT SDXC.

Apacer SD CV110-SD Secure Digital 4.0 card with high performance, good reliability and wide compatibility is nowadays one of the most popular cards well adapted for hand-held applications with customized firmware techniques in semi-industrial/medical markets already.

1.1 Functional Block

The SD contains a flash controller and flash media with SD standard interface.

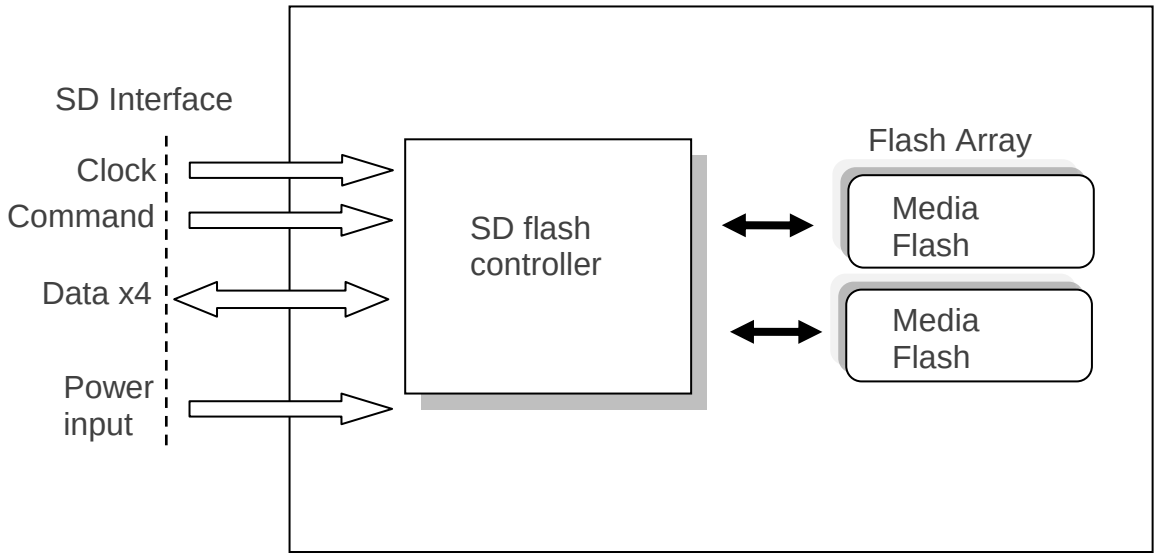

Figure 1-1 Functional Block Diagram

1.2 Flash Management

1.2.1 Bad Block Management

The SD controller contains logical/physical flash block mapping and bad block management system. It will manage all flash block include user data space and spare block.

The SD also contains a sophisticated defect and error management system. It does a read after write under margin conditions to verify that the data is written correctly (except in the case of write pre-erased sectors). In case that a bit is found to be defective, the SD replaces this bad bit with a spare bit within the sector header. If necessary, the SD will even replace the entire sector with a spare sector. This is completely transparent to the master (host device) and does not consume any user data space.

1.2.2 Powerful ECC Algorithms

Flash memory cells will deteriorate with use, which might generate random bit errors in the stored data. Thus, the SD card applies the advanced ECC Algorithm, which can detect and correct errors occur during read process, ensure data been read correctly, as well as protect data from corruption.

1.2.3 S.M.A.R.T.

S.M.A.R.T. (SMART), an acronym stands for Self-Monitoring, Analysis and Reporting Technology, is an open standard allowing an individual disk drive in the ATA/IDE or SCSI interface to automatically monitor its own health and report potential problems in order to prevent data loss. This failure warning technology provides predictions from unscheduled downtime by observing and storing critical drive performance and calibration parameters. Ideally, this should allow taking hands-on actions to keep from impending drive failure.

Failures are divided into two categories: those that can be predicted and those that cannot. Predictable failures occur gradually over time, and the decline in performance can be detected; on the other hand, unpredictable failures happen very sudden without any warning. These failures may be caused by power surges or related to electronic components. The purpose of the SMART implementation is to predict near-term failures of each individual disk drive and generate a warning to prevent unfortunate loss.

1.2.4 Global Wear Leveling

NAND Flash devices can only undergo a limited number of program/erase cycles, and in most cases, the flash media are not used evenly. If some area get updated more frequently than others, the lifetime of the device would be reduced significantly. Thus, Global Wear Leveling technique is applied to extend the lifespan of NAND Flash by evenly distributing writes and erase cycles across the media.

Apacer provides Global Wear Leveling algorithm, which can efficiently spread out the flash usage through the whole flash media area. Moreover, by implementing Global Wear Leveling algorithm, the life expectancy of the NAND Flash is greatly improved.

1.2.5 DataRAID™

Apacer's DataRAID algorithm applies an additional level of protection and error-checking. Using this algorithm, a certain amount of space is given over to aggregating and resaving the existing parity data used for error checking. So, in the event that data becomes corrupted, the parity data can be compared to the existing uncorrupted data and the content of the corrupted data can be rebuilt.

1.2.6 SMART Read Refresh™

Apacer's SMART Read Refresh plays a proactive role in avoiding read disturb errors from occurring to ensure health status of all blocks of NAND flash. Developed for read-intensive applications in particular, SMART Read Refresh is employed to make sure that during read operations, when the read operation threshold is reached, the data is refreshed by re-writing it to a different block for subsequent use.

8	DAT1	Data line[Bit 1]	Reserved	
9	DAT2	Data line[Bit 2]	Reserved	

2.3 Capacity

The following table shows the specific capacity for the SD 6.1 card.

Table 2-2 Capacity Specifications

Capacity	Total bytes*
32 GB	30,941,380,608
64 GB	62,226,694,144
128 GB	125,342,580,736
256 GB	251,943,452,672

Note: Total bytes are viewed under Windows operating system and were measured by SD format too.

2.4 Performance

Performances of the SD 6.1 card are shown in the table below.

Table 2-3 Performance Specifications

Capacity / Performance	32 GB	64 GB	128 GB	256 GB
Sequential Read* (MB/s)	90	90	90	90
Sequential Write* (MB/s)	22	34	33	27
Random Read IOPS (4K)**	1,300	1,300	1,300	1,300
Random Write IOPS (4K)**	31	25	42	41

Note:
Results may differ from various flash configurations or host system setting.
*Sequential performance is based on CrystalDiskMark 5.2.1 with file size 1,000MB.
**Random performance measured using IOMeter with Queue Depth 32.
***Performance results are measured based on USB 3.0 card reader.

2.5 Electrical

Table 2-4 Operating Voltages

Symbol	Parameter	Min.	Max.	Unit
V_{DD}	Power Supply Voltage	2.7	3.6	V

Table 2-5 Power Consumption

Mode / Capacity	32 GB	64 GB	128 GB	256 GB
Operating (mA)	70	95	100	105
Standby (µA)	95	120	130	185

Note:
*All values are typical and may vary depending on flash configurations or host system settings.
**Active power is an average power measurement performed using CrystalDiskMark with 128KB sequential read/write transfers.
***Power is measured based on USB 3.0 card reader.

2.6 Endurance

The endurance of a storage device is predicted by TeraBytes Written based on several factors related to usage, such as the amount of data written into the drive, block management conditions, and daily workload for the drive. Thus, key factors, such as Write Amplifications and the number of P/E cycles, can influence the lifespan of the drive.

Table 2-6 Endurance Specifications

Capacity	TeraBytes Written
32 GB	82
64 GB	163
128 GB	312
256 GB	614

Note:

- This estimation complies with Apacer internal workload.
- Flash vendor guaranteed 3D NAND TLC P/E cycle: 3K
- WAF may vary from capacity, flash configurations and writing behavior on each platform.
- 1 Terabyte = 1,024GB
- DWPD (Drive Write Per Day) is calculated based on the number of times that user can overwrite the entire capacity of an SSD per day of its lifetime during the warranty period. (3D NAND TLC warranty: 2 years)

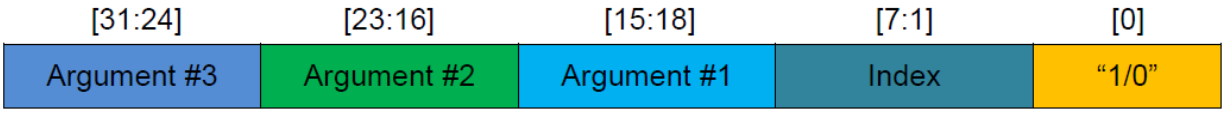
5. S.M.A.R.T.

5.1 Direct Host Access to SMART Data via SD General Command (CMD56)

CMD 56 is structured as a 32-bit argument. The implementation of the general purpose functions will arrange the CMD56 argument into the following format:



- Bit [0]: Indicates Read Mode when bit is set to [1] or Write Mode when bit is cleared [0]. Depending on the function, either Read Mode or Write Mode can be used.
- Bit [7:1]: Indicates the index of the function to be executed:
  - Read Mode: Index = 0x10 Get SMART Command Information
  - Write Mode: Index = 0x08 Pre-Load SMART Command Information
- Bit [15:8]: Function argument #1 (1-byte)
- Bit [23:16]: Function argument #2 (1-byte)
- Bit [31:24]: Function argument #3 (1-byte)

5.2 Process for Retrieving SMART Data

Retrieving SMART data requires the following two commands executed in sequence and in accordance with the SD Association standard flowchart for CMD56 (see below).

Step 1: Write Mode – [0x08] Pre-Load SMART Command Information

Sequence	Command	Argument	Expected Data
Pre-Load SMART Command Information	CMD56	[0] “0” (Write Mode) [1:7] “0001 000” (Index = 0x08) [8:511] All ‘0’ (Reserved)	No expected data

Step 2: Read Mode – [0x10] Get SMART Command Information

Sequence	Command	Argument	Expected Data
Get SMART Command Information	CMD56	[0] "1" (Read Mode) [1:7] "0010 000" (Index = 0x10) [8:31] All '0' (Reserved)	1 sector (512 bytes) of response data byte[0-8] Flash ID byte[9-10] IC Version byte[11-12] FW Version byte[13] Reserved byte[14] CE Number byte[15] Reserved byte[16-17] Bad Block Replace Maximum byte[18] Reserved byte[32-63] Bad Block count per Die byte[64-65] Good Block Rate(%) byte[66-79] Reserved byte[80-83] Total Erase Count byte[84-95] Reserved byte[96-97] Endurance (Remain Life) (%) byte[98-99] Average Erase Count – L* byte[100-101] Minimum Erase Count – L* byte[102-103] Maximum Erase Count – L* byte[104-105] Average Erase Count – H* byte[106-107] Minimum Erase Count – H* byte[108-109] Maximum Erase Count – H* byte[110-111] Reserved byte[112-115] Power Up Count byte[116-127] Reserved byte[128-129] Abnormal Power Off Count byte[130-159] Reserved byte[160-161] Total Refresh Count byte[176-183] Product "Marker" byte[184-215] Bad Block count per Die byte[216-511] Reserved

*Please refer to technical note for High/Low byte definition.
