FEATURES:

- **Fully Compatible with SD Card Specifications 3.0, 2.0 and 1.1**
  - Part 1, Physical Layer Specification, Ver 3.01 Final
  - Part 2, File System Specification, Ver 3.00
  - Part 3, Security Specification, Ver 3.00 Final
- **Capacity**
  - 256 MB, 512 MB, 1 GB, 2 GB
- **Performance***
  - Sustained Read: Up to 20 MB/sec
  - Sustained Write: Up to 16 MB/sec
- **Non-UHS Bus Speed Mode**
- **SD-Protocol Compatible**
- **Supports SD SPI Mode**
- **NAND Flash Type: SLC**
- **Flash Management**
  - Bad block management
  - Built-in advanced ECC algorithms
  - S.M.A.R.T.
  - Wear-leveling algorithms
  - Auto-read refresh
  - Power failure management
- **Temperature Range**
  - Operating temperature:
    Standard: -25°C to 85°C
    Extended: -40°C to 85°C
  - Storage temperature: -40°C to 85°C
- **Operating Voltage: 2.7V ~ 3.6V**
- **Power Consumption***
  - Operating: 60 mA
  - Standby: 100 µA
- **Dimensions:** 15㎜(L) x 11㎜(W) x 1㎜(H)
- **RoHS Recast Compliant (2011/65/EU)**

*Performance values presented here are typical and may vary depending on settings and platforms.

TABLE OF CONTENTS

1. General Description

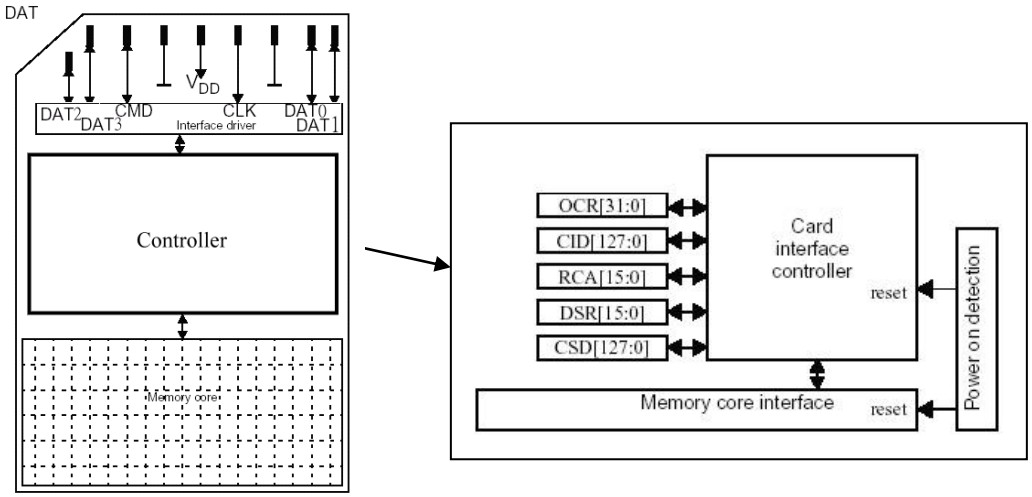
The Micro Secure Digital (MicroSD) card is fully compliant to the specification released by SD Card Association. The Command List supports [Part 1 Physical Layer Specification Ver3.01 Final] definitions. Card Capacity of Non-secure Area, Secure Area Supports [Part 3 Security Specification Ver3.00 Final] Specifications.

The MicroSD card comes with 8-pin interface, designed to operate at optimal performance. It can alternate communication protocol between the SD mode and SPI mode. It performs data error detection and correction with very low power consumption.

Apacer Industrial Micro Secure Digital card is ideal for its high performance, good reliability and wide compatibility. Not to mention that it's well adapted for hand-held applications in semi-industrial/medical markets already. The new MicroSD card is capable of delivering better performance and P/E cycles.

1.1 Product Function Block

The MicroSD contains a card controller and a memory core for the SD standard interface.



1.2 Functional Description

The MicroSD device contains a high level, intelligent flash management that provides many capabilities including:

- Bad block management
- ECC algorithms
- S.M.A.R.T.
- Wear leveling algorithms
- Auto-read refresh
- Power failure management

1.2.1 Bad Block Management

The SD controller contains logic/physical flash block mapping and bad block management system. It will manage all flash block including user data space and spare block.

The MicroSD also contains a sophisticated defect and error management system. It does a read after write under margin conditions to verify that the data is written correctly (except in the case of write pre-erased sectors). In case that a bit is found to be defective, the SD will replace this bad bit with a spare bit within the sector header. If necessary, the MicroSD will even replace the entire sector with a spare sector. This is completely transparent to the master (host device) and does not consume any user data space.

1.2.2 ECC Algorithms

The powerful ECC algorithms will enhance flash block use rate and whole device life. The SD controller supports up to 68bits ECC circuits to protect data transfer.

1.2.3 S.M.A.R.T.

S.M.A.R.T. (SMART), an acronym stands for Self-Monitoring, Analysis and Reporting Technology, is an open standard allowing an individual disk drive in the ATA/IDE or SCSI interface to automatically monitor its own health and report potential problems in order to prevent data loss. This failure warning technology provides predictions from unscheduled downtime by observing and storing critical drive performance and calibration parameters. Ideally, this should allow taking hands-on actions to keep from impending drive failure.

Failures are divided into two categories: those that can be predicted and those that cannot. Predictable failures occur gradually over time, and the decline in performance can be detected; on the other hand, unpredictable failures happen very sudden without any warning. These failures may be caused by power surges or related to electronic components. The purpose of the SMART implementation is to predict near-term failures of each individual disk drive and generate a warning to prevent unfortunate loss.

1.2.4 Wear Leveling

NAND Flash devices can only undergo a limited number of program/erase cycles, and in most cases, the flash media are not used evenly. If some area get updated more frequently than others, the lifetime of the device would be reduced significantly. Thus, Wear Leveling technique is applied to extend the lifespan of NAND Flash by evenly distributing write and erase cycles across the media.

Apacer provides wear leveling algorithm, which can efficiently spread out the flash usage through the whole flash media area. Moreover, by implementing both dynamic and static Wear Leveling algorithms, the life expectancy of the NAND Flash is greatly improved.

1.2.5 Auto-Read Refresh

When continuously being read, NAND flash memory cannot engage wear leveling since this applies while writing data. Subsequently, errors aggregated over time and become uncorrectable. To keep errors from going beyond ECC's capability to recover and memory blocks in good hands, Apacer's Auto-Read Refresh will spontaneously refresh the bit errors when the threshold is triggered by the error count in a block.

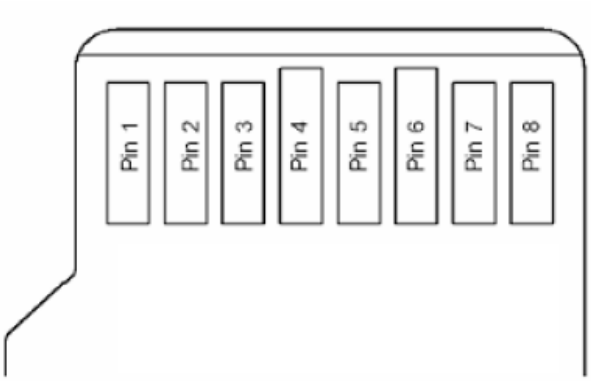
1.2.6 Power Failure Management

Apacer industrial SD and MicroSD cards provide complete data protection mechanism during every abnormal power shutdown situation, such as power failure at programming data, updating system tables, erasing blocks, etc. Apacer Power-Loss Protection mechanism includes:

- Maintaining data correctness and increasing the reliability of the data stored in the NAND Flash memory.
- Protecting F/W table and the data written to flash from data loss in the event of power off.

2. Electrical Characteristics

2.1 Card Architecture



2.2 Pin Assignment

Pin	SD Mode		SPI Mode	
	Name	Description	Name	Description
1	DAT2	Data Line[Bit 2]	RSV	Reserved
2	CD/DAT3	Card Detect/Data Line[Bit 3]	CS	Chip Select (neg true)
3	CMD	Command/Response	DI	Data In
4	VDD	Supply Voltage	VDD	Supply Voltage
5	CLK	Clock	SCLK	Clock
6	VSS	Supply Voltage Ground	VSS	Supply Voltage Ground
7	DAT0	Data Line[Bit 0]	DO	Data Out
8	DAT1	Data Line[Bit 1]	RSV	Reserved

2.3 Capacity Specifications

The following table shows the specific capacity for the SD card.

Capacity	Total Bytes
256 MB	248,643,584
512 MB	497,287,168
1 GB	996,868,096
2 GB	1,980,432,384

Note: Total bytes are viewed under Windows operating system and were measured by SD format too.

2.4 Performance Specifications

Performance of the SD card is shown in the table below.

Capacity / Modes	256 MB	512 MB	1 GB	2 GB
Read (MB/s)	15	20	19	19
Write (MB/s)	9	15	16	15

Note: Results may vary depending on settings and platforms.

2.5 Electrical Specifications
