FEATURES:

- **Fully Compatible with SD Card Specifications 3.0, 2.0 and 1.1**
 - Part 1, Physical Layer Specification, Ver 3.00 Final
 - Part 2, File System Specification, Ver 3.00
 - Part 3, Security Specification, Ver 3.00 Final
- **Capacity**
 - 8, 16 GB
- **Performance***
 - Sustained Read: Up to 43 MB/sec
 - Sustained Write: Up to 35 MB/sec
- **Power Consumption***
 - Operating: 130 mA
 - Standby: 285 μ A
- **SD-Protocol Compatible**
- **Supports SD SPI Mode**
- **Standard Interface**
 - 8-pins SD interface
- **NAND Flash Type: MLC**
- **Flash Management**
 - Flash bad-block management
 - Built-in advanced ECC algorithms
 - Power management
 - S.M.A.R.T.
 - Wear-leveling algorithms
 - Page mapping
 - Auto read refresh
 - Power failure management
- **Temperature Range**
 - Operating temperature:
 - Standard: -25°C to 85°C
 - Extended: -40°C to 85°C
 - Storage temperature: -40°C to 85°C
- **Operating Voltage: 2.7V ~ 3.6V**
- **Dimensions: 15mm(L) x 11mm(W) x 1mm(H)**
- **RoHS Recast Compliant (2011/65/EU)**

*Performance values presented here are typical and may vary depending on settings and platforms.

1. General Description

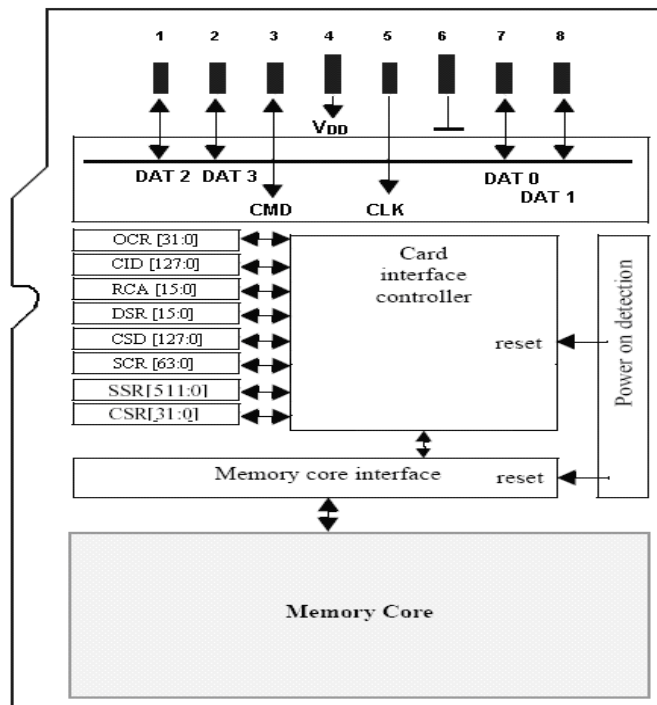

As the demand of reliable and high-performance data storage in a small form factor increases, Apacer's MicroSD card is designed specifically for multiple applications by offering high endurance, reliability, and agility, where extreme flexibility, endurance, data integrity, and exceptionally transmission are required.

The MicroSD card fully complies with SD Card Association standard. The Command List is compatible with [Part 1 Physical Layer Specification Ver3.0 Final] definitions, while the Card Capacity of Non-secure Area, Secure Area supports [Part 3 Security Specification Ver3.0 Final] Specifications. The card allows selection of either SD or SPI mode for compatibility in data communication.

The card also comes with endurance features for data error detection and correction.

1.1 Product Function Block

The MicroSD contains a card controller and a memory core for the SD standard interface.

1.2 Functional Description

The MicroSD device contains a high level, intelligent flash management that provides many capabilities including:

- Flash bad-block management
- ECC algorithms
- Power management
- S.M.A.R.T.
- Wear leveling algorithms
- Page mapping
- Auto read refresh
- Power failure management

1.2.1 Flash Management

The SD controller contains logic/physical flash block mapping and bad block management system. It will manage all flash block including user data space and spare block.

The MicroSD also contains a sophisticated defect and error management system. It does a read after write under margin conditions to verify that the data is written correctly (except in the case of write pre-erased sectors). In case that a bit is found to be defective, the SD will replace this bad bit with a spare bit within the sector header. If necessary, the MicroSD will even replace the entire sector with a spare sector. This is completely transparent to the master (host device) and does not consume any user data space.

1.2.2 ECC Algorithms

The powerful ECC algorithms will enhance flash block use rate and whole device life. The SD controller supports up to 68bits ECC circuits to protect data transfer.

1.2.3 Power Management

A power saving feature of the MicroSD is automatic entrance and exit from sleep mode. Upon completion of an operation, the SD will enter the sleep mode to conserve power if no further commands are received within X seconds, where X is programmable by software. The master does not have to take any action for this to occur. The SD is in sleep mode except when the host is accessing it, thus conserving power.

Any command issued by the master to the MicroSD will cause it to exit sleep mode and response to the master.

1.2.4 S.M.A.R.T.

S.M.A.R.T. (SMART), an acronym stands for Self-Monitoring, Analysis and Reporting Technology, is an open standard allowing an individual disk drive in the ATA/IDE or SCSI interface to automatically monitor its own health and report potential problems in order to prevent data loss. This failure warning technology provides predictions from unscheduled downtime by observing and storing critical drive performance and calibration parameters. Ideally, this should allow taking hands-on actions to keep from impending drive failure.

Failures are divided into two categories: those that can be predicted and those that cannot. Predictable failures occur gradually over time, and the decline in performance can be detected; on the other hand, unpredictable failures happen very sudden without any warning. These failures may be caused by power surges or related to electronic components. The purpose of the SMART implementation is to predict near-term failures of each individual disk drive and generate a warning to prevent unfortunate loss.

1.2.5 Wear Leveling Algorithms

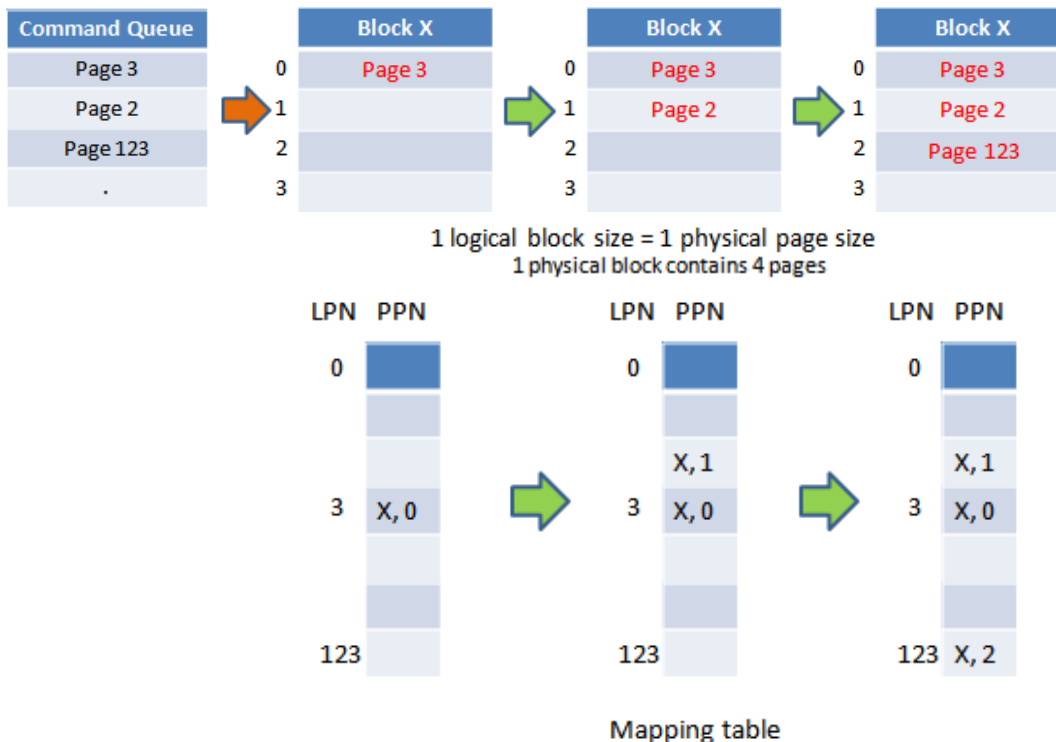

NAND Flash devices can only undergo a limited number of program/erase cycles, and in most cases, the flash media are not used evenly. If some area get updated more frequently than others, the lifetime of the device would be reduced significantly. Thus, Wear Leveling technique is applied to extend the lifespan of NAND Flash by evenly distributing write and erase cycles across the media.

Apacer provides wear leveling algorithm, which can efficiently spread out the flash usage through the whole flash media area. Moreover, by implementing both dynamic and static Wear Leveling algorithms, the life expectancy of the NAND Flash is greatly improved.

1.2.6 Page Mapping

Page-level mapping uses one page as the unit of mapping. The most important characteristic of page-level mapping is that each logical page can be mapped to any physical page on the flash memory device. This mapping algorithm allows different size of data to be written to a block as if the data is written to a data pool and it does not need to take extra operations to process a write command. The below example shows how page-level mapping performs a write command:

Host instructs three write commands: page 3, 2, and 123. The three pages are written into block X in sequence of command queue. Once all write commands are completed, the mapping table updates itself automatically.

Note: The example only shows the concept of how page-level mapping work and do not necessary

happen in an actual case.

This fine-grained page-level mapping scheme makes better capability for handling random data, and increases overall performance and endurance significantly. However, page-level mapping requires SSDs to incorporate a larger RAM in order to maintain its mapping table.

1.2.7 Auto Read Refresh

Apacer develops a mechanism called “Auto Read Refresh” to enhance the protection against error bits multiplying. This function is implemented so that the possibility of encountering errors not being corrected for applications that perform read operations during most of its life cycle, like GPS, server host and data sharing hub, etc, can be reduced to ensure smooth usage.

1.2.8 Power Failure Management

Apacer industrial SD and MicroSD cards provide complete data protection mechanism during every abnormal power shutdown situation, such as power failure at programming data, updating system tables, erasing blocks, etc. Apacer Power-Loss Protection mechanism includes:

- Maintaining data correctness and increasing the reliability of the data stored in the NAND Flash memory.
- Protecting F/W table and the data written to flash from data loss in the event of power off.
