Specifications Overview:

- **Fully Compatible with SD Card Specifications 3.0, 2.0 and 1.1**
 - Part 1, Physical Layer Specification, Ver 3.00 Final
 - Part 2, File System Specification, Ver 3.00
 - Part 3, Security Specification, Ver 3.00 Final
- **Capacity**
 - 8, 16 GB
- **Performance***
 - Sequential read: Up to 90 MB/sec
 - Sequential write: Up to 32 MB/sec
 - Random read (4K): Up to 1,400 IOPS
 - Random write (4K): Up to 140 IOPS
- **Flash Management**
 - Built-in advanced ECC algorithm
 - Global Wear Leveling
 - Flash bad-block management
 - Page Mapping
 - S.M.A.R.T.
 - Power Failure Management
 - SMART Read Refresh™
- **NAND Flash Type: MLC**
- **Standard Interface**
 - 8-pins SD interface
- **Endurance (in Terabytes Written: TBW)**
 - 8 GB: 9 TBW
 - 16 GB: 18 TBW
- **Temperature Range**
 - Operating: -40°C to 85°C
 - Storage: -40°C to 85°C
- **Operating Voltage: 2.7V ~ 3.6V**
- **Power Consumption***
 - Operating: 105 mA
 - Standby: 295 μA
- **Bus Speed Mode: Support Class 10 with UHS-I****
 - DS: Default Speed up to 25MHz 3.3V signaling
 - HS: High Speed up to 50MHz 3.3V signaling
 - SDR12: SDR up to 25MHz 1.8V signaling
 - SDR25: SDR up to 50MHz 1.8V signaling
 - SDR50: SDR up to 100MHz 1.8V signaling
 - SDR104: SDR up to 208MHz 1.8V signaling
 - DDR50: DDR up to 50MHz 1.8V signaling
- **SD-Protocol Compatible**
- **Supports SD SPI Mode**
- **Physical Dimensions: 15mm (L) x 11mm (W) x 1mm (H)**
- **RoHS Recast Compliant (2011/65/EU)**

*Varies from capacities. Performance values presented here are typical and measured based on USB 3.0 card reader. The results may vary depending on settings and platforms.

**Timing in 1.8V signaling is different from that of 3.3V signaling. Operation mode selection command is compliant with SD 3.0, referring to SDA's Part 1, Physical Layer Specification, Ver 3.01 (Section 3.9)

1. General Descriptions

As the demand of reliable and high-performance data storage in a small form factor increases, Apacer's MicroSD card is designed specifically for multiple applications by offering high endurance, reliability, and agility, where extreme flexibility, endurance, data integrity, and exceptionally transmission are required.

The MicroSD card fully complies with SD Card Association standard. The Command List is compatible with [Part 1 Physical Layer Specification Ver3.0 Final] definitions, while the Card Capacity of Non-secure Area, Secure Area supports [Part 3 Security Specification Ver3.0 Final] Specifications. The card allows selection of either SD or SPI mode for compatibility in data communication.

The card also comes with endurance features for data error detection and correction.

1.1 Product Functional Block

The MicroSD contains a card controller and a memory core for the SD standard interface.

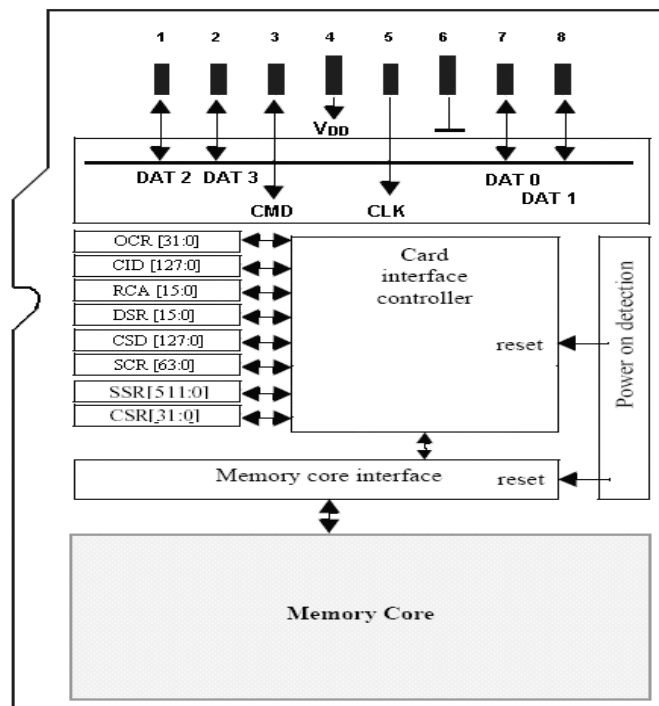

Figure 1-1 Block Diagram

1.2 Flash Management

1.2.1 Bad Block Management

Bad blocks are blocks that include one or more invalid bits, and their reliability is not guaranteed. Blocks that are identified and marked as bad by the manufacturer are referred to as “Initial Bad Blocks”. Bad blocks that are developed during the lifespan of the flash are named “Later Bad Blocks”. Apacer implements an efficient bad block management algorithm to detect the factory-produced bad blocks and manages any bad blocks that appear with use. This practice further prevents data being stored into bad blocks and improves the data reliability.

1.2.2 Powerful ECC Algorithms

Flash memory cells will deteriorate with use, which might generate random bit errors in the stored data. Thus, the MicroSD card applies the BCH ECC Algorithm, which can detect and correct errors occur during read process, ensure data been read correctly, as well as protect data from corruption. The MicroSD controller can detect and correct up to 43 bits error in 1K bytes.

1.2.3 Global Wear Leveling

NAND Flash devices can only undergo a limited number of program/erase cycles, and in most cases, the flash media are not used evenly. If some area get updated more frequently than others, the lifetime of the device would be reduced significantly. Thus, Global Wear Leveling technique is applied to extend the lifespan of NAND Flash by evenly distributing writes and erase cycles across the media.

Apacer provides Global Wear Leveling algorithm, which can efficiently spread out the flash usage through the whole flash media area. Moreover, by implementing Global Wear Leveling algorithm, the life expectancy of the NAND Flash is greatly improved.

1.2.4 S.M.A.R.T.

SMART, an acronym for Self-Monitoring, Analysis and Reporting Technology, is a special function that allows a memory device to automatically monitor its health. Apacer provides a program named SmartInfo Tool to observe Apacer’s SD and MicroSD cards. Note that this tool can only support Apacer’s industrial SD and MicroSD cards. This tool will display firmware version, endurance life ratio, good block ratio, and so forth.

1.2.5 Power Failure Management

Apacer industrial SD and MicroSD cards provide complete data protection mechanism during every abnormal power shutdown situation, such as power failure at programming data, updating system tables, erasing blocks, etc. Apacer Power-Loss Protection mechanism includes:

- Maintaining data correctness and increasing the reliability of the data stored in the NAND Flash memory.
- Protecting F/W table and the data written to flash from data loss in the event of power off.

1.2.6 SMART Read Refresh™

Apacer’s SMART Read Refresh plays a proactive role in avoiding read disturb errors from occurring to ensure health status of all blocks of NAND flash. Developed for read-intensive applications in particular, SMART Read Refresh is employed to make sure that during read operations, when the read operation threshold is reached, the data is refreshed by re-writing it to a different block for subsequent use.

1.2.7 Page Mapping

Page-level mapping uses one page as the unit of mapping. The most important characteristic of page-level mapping is that each logical page can be mapped to any physical page on the flash memory device. This mapping algorithm allows different size of data to be written to a block as if the data is written to a data pool and it does not need to take extra operations to process a write command. The below example shows how page-level mapping performs a write command:

Host instructs three write commands: page 3, 2, and 123. The three pages are written into block X in sequence of command queue. Once all write commands are completed, the mapping table updates itself automatically.

Note: The example only shows the concept of how page-level mapping work and do not necessary happen in an actual case.

This fine-grained page-level mapping scheme makes better capability for handling random data, and increases overall performance and endurance significantly. However, page-level mapping requires SSDs to incorporate a larger RAM in order to maintain its mapping table.

2.2 Pin Assignment

Table 2-1 Pin Descriptions

Pin	SD Mode		SPI Mode	
	Name	Description	Name	Description
1	DAT2	Data Line[Bit 2]	RSV	Reserved
2	CD/DAT3	Card Detect/Data Line[Bit 3]	CS	Chip Select (neg true)
3	CMD	Command/Response	DI	Data In
4	VDD	Supply Voltage	VDD	Supply Voltage
5	CLK	Clock	SCLK	Clock
6	VSS	Supply Voltage Ground	VSS	Supply Voltage Ground
7	DAT0	Data Line[Bit 0]	DO	Data Out
8	DAT1	Data Line[Bit 1]	RSV	Reserved

2.3 Capacity Specifications

The following table shows the specific capacity for the SD card.

Table 2-2 Capacity Specifications

Capacity	Total bytes*
8 GB	7,734,296,576
16 GB	15,468,593,152

Note: Total bytes are viewed under Windows operating system and were measured by SD format too.

2.4 Performance Specifications

Performances of the SD card are shown in the table below.

Table 2-3 Performance Specifications

Capacity	8 GB	16 GB
Sequential Read* (MB/s)	90	90
Sequential Write* (MB/s)	21	32
Random Read IOPS** (4K)	1,400	1,300
Random Write IOPS** (4K)	100	140

Note:

Results may differ from various flash configurations or host system setting.

*Sequential performance is based on CrystalDiskMark 5.2.1 with file size 1,000MB.

**Random performance measured using IOMeter with Queue Depth 32.

***Performance results are measured based on USB 3.0 card reader.

2.5 Electrical Specifications

Table 2-4 Operating Voltage

Symbol	Parameter	Min.	Max.	Unit
V _{DD}	Power Supply Voltage	2.7	3.6	V

Table 2-5 Power Consumption

Capacity	8 GB	16 GB
Operating (mA)	95	105
Standby (µA)	265	295

Note:

*All values are typical and may vary depending on flash configurations or host system settings.

**Active power is an average power measurement performed using CrystalDiskMark with 128KB sequential read/write transfers.

2.6 Endurance

The endurance of a storage device is predicted by TeraBytes Written based on several factors related to usage, such as the amount of data written into the drive, block management conditions, and daily workload for the drive. Thus, key factors, such as Write Amplifications and the number of P/E cycles, can influence the lifespan of the drive.

Table 2-6 Endurance Specifications

Capacity	TeraBytes Written
8 GB	9
16 GB	18

Note:

- The measurement assumes the data written to the SSD for test is under a typical and constant rate.
- The measurement follows the standard metric: 1 TB (Terabyte) = 1,000 GB.
- The estimated values are based on JEDEC Enterprise endurance workload comprised of random data with the payload size distribution with sequential write behavior.
